What is a dashboard?

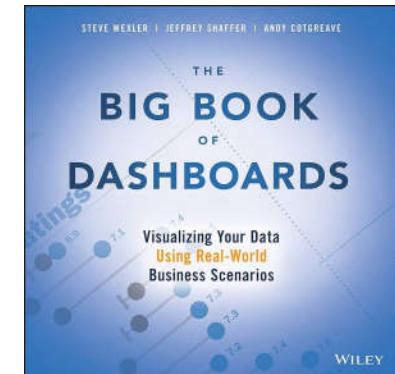

“A dashboard is a visual display of the most important information needed to achieve one or more objectives; consolidated and arranged on a single screen so the information can be monitored at a glance.”

*Stephen Few
(2004)*

“A dashboard is a visual display of data used to monitor conditions and/or facilitate **understanding**”

*Big Book of
Dashboards

What makes a good dashboard?

- Answers a set of questions
- Follows a flow and invites interactivity
- Condensed; primarily in the form of summaries and exceptions
- Specific to and customized for the dashboard's audience and objectives
- Provides appropriate text for clarity and direction, if needed
- Makes strategic use of color

Alabama Baldwin County 1979 September Class A Man recalls a sighting after Hurricane Frederic north of Mobile
Baldwin County 1980 January Class A Motorists pulled over on a rural highway at night describe strange lights in headlights

Bigfoot sightings are in decline

Data gathered from the official website of the "Bigfoot Field Researchers Organization" (BFRO).

The data was attempted to be scrubbed and cleaned to attain some type of normalcy, unfortunately the BFRO data submission process has no validation and fields are often used arbitrarily by submitters.

BFRO does the "Finding Bigfoot" Animal Planet TV show.

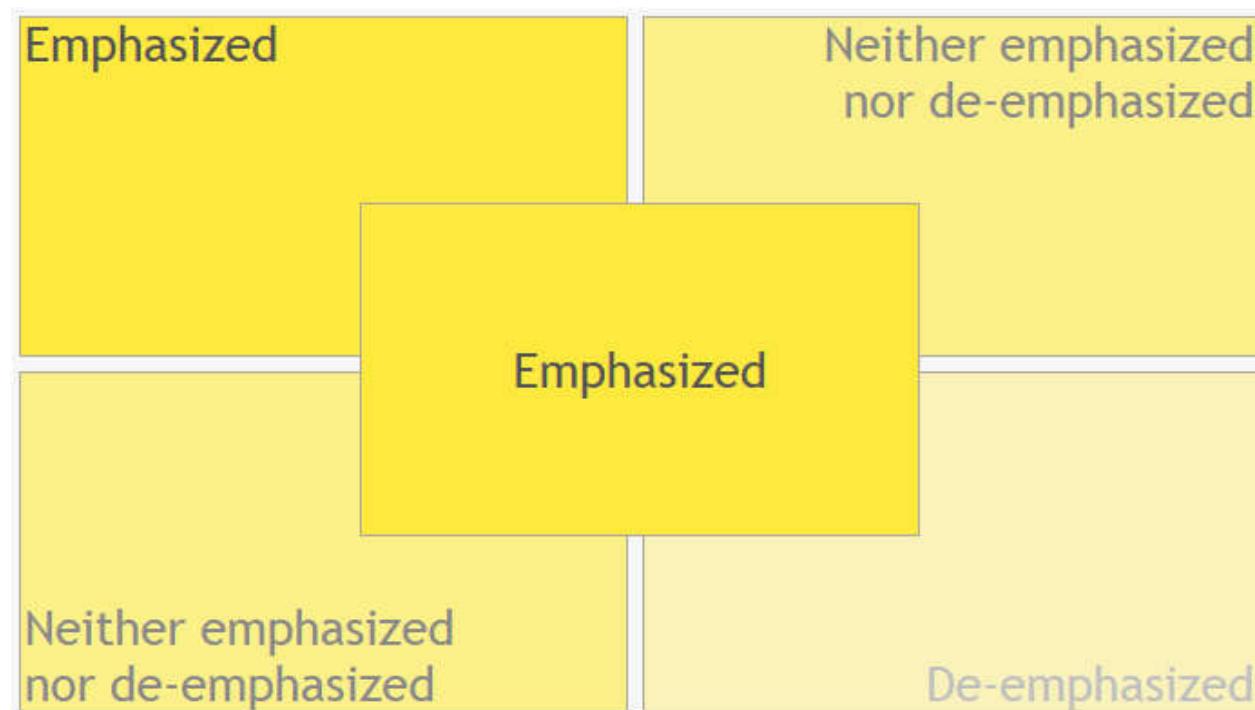

Click on ANY element of the visualization (location, season, year, detail field) in order to filter by that item.

BIG POKER DASHBOARDS

Downloaded by Steve Weller

Data: Retailer Data

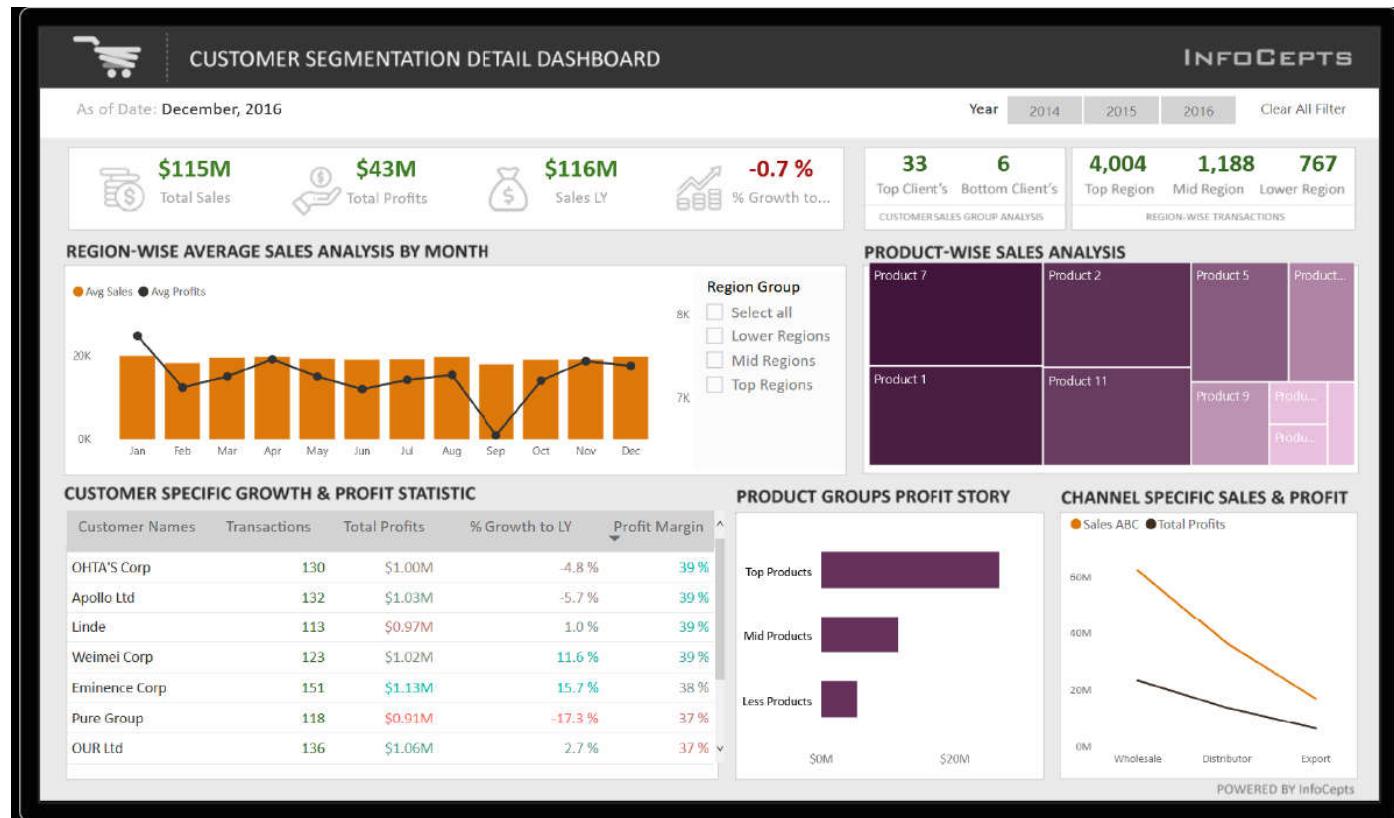

Does the dashboard pass the 5 second test?

- Most important view is on top or top left
- Legends are near their views
- Avoid multiple color schemes
- Uses 5 or fewer views (charts)

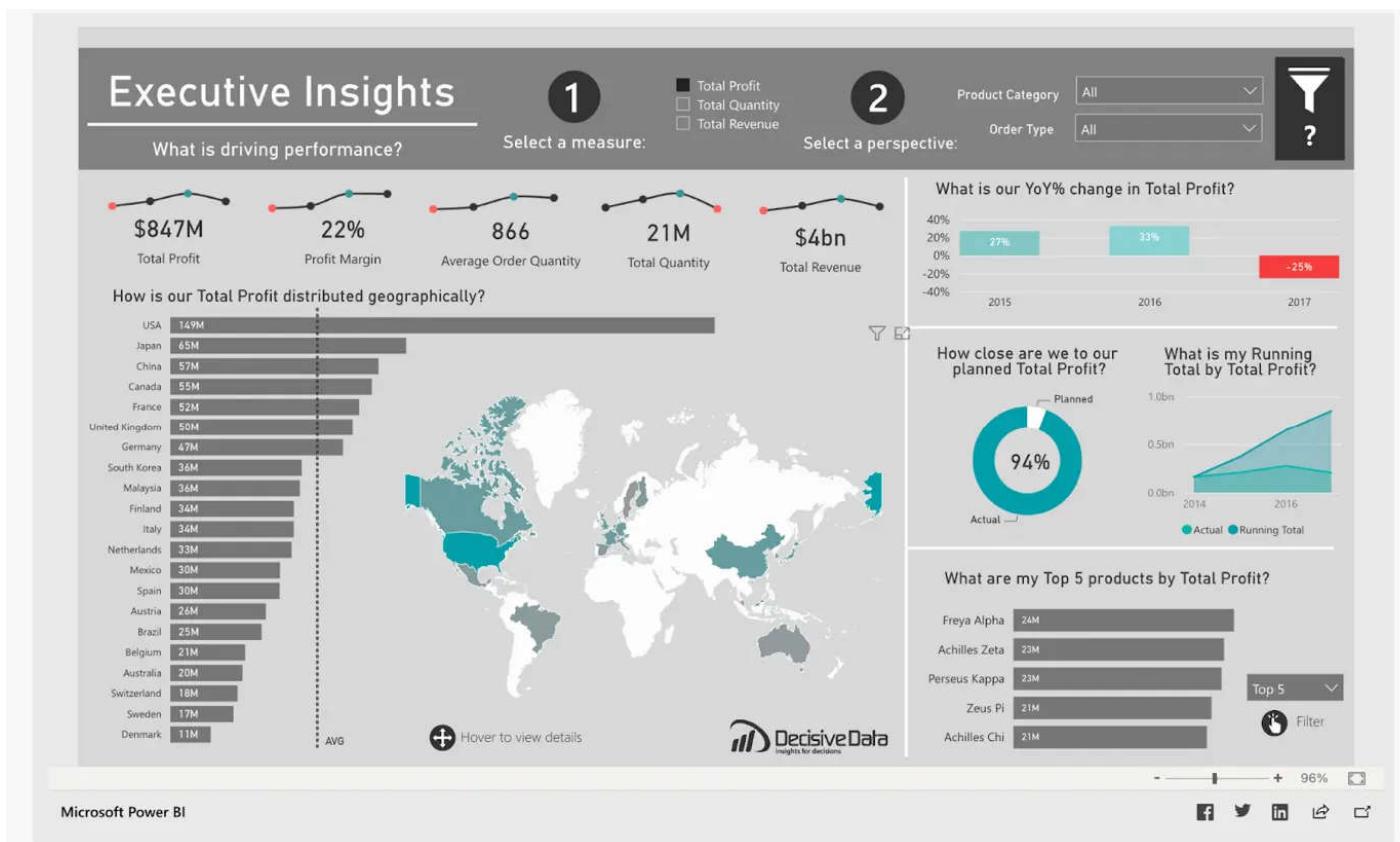

Dashboard Mistakes

- Not creating a clear goal for the dashboard
- Presenting too much information in one dashboard
- Including unnecessary information
- Representing data in the wrong type of graph or chart
- Using a cluttered, confusing, or inaccessible design
- Including too many colors
- Including decimals

Example: Sales Dashboard

Example: Financial Dashboard

Using Tooltips

Tooltips can make the difference between a user loving your visualization and not understanding it.

Tips for improving the basic tooltip

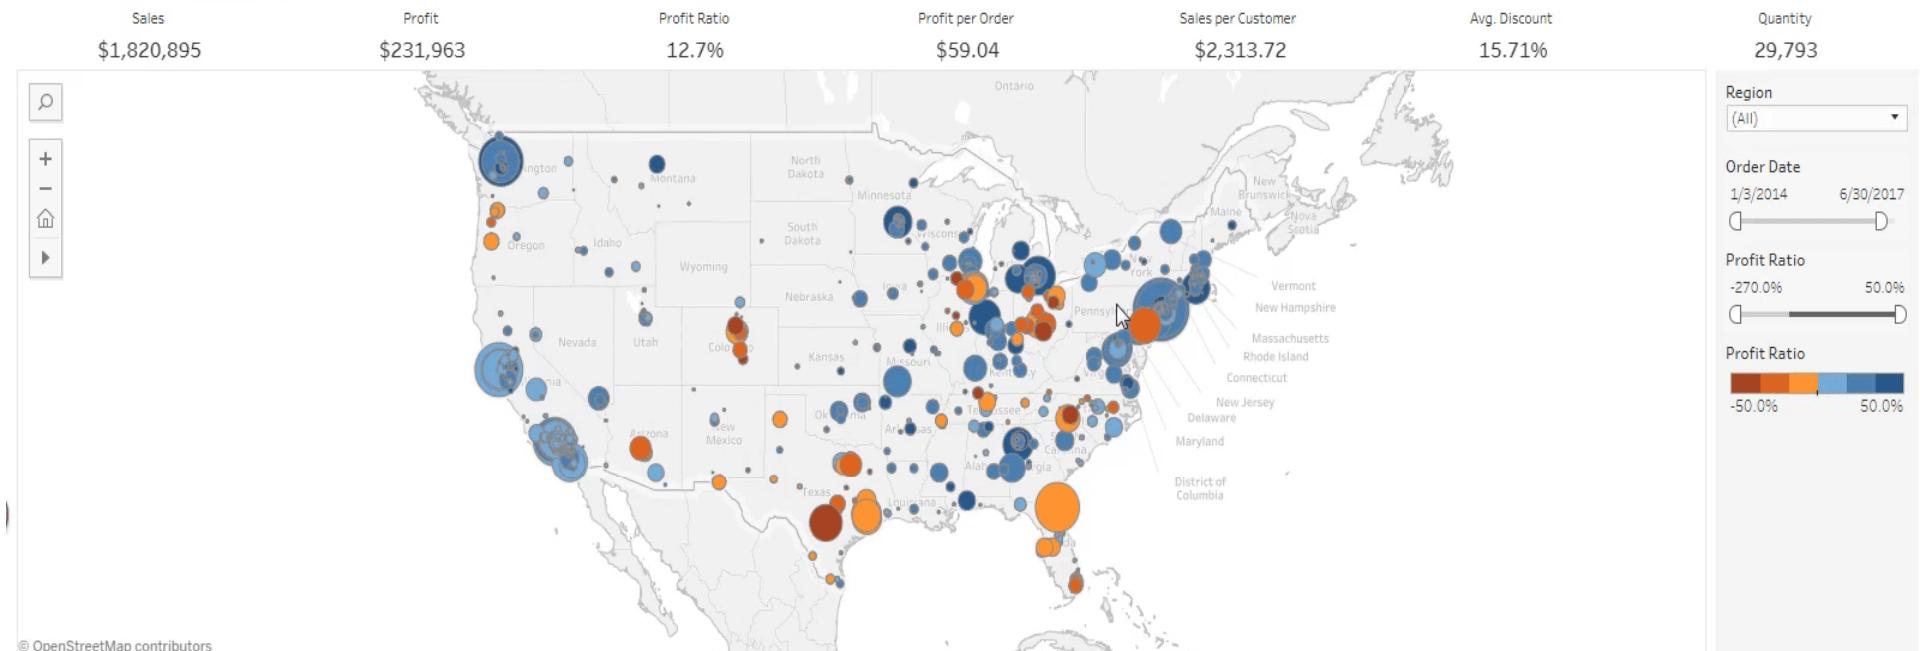

- Use a proper font
- Identify the most important part of the tool tip and make it your title
- Change measure names/values to make them specific and understandable
- Include proper units
- Remove command prompts

Storytelling

Data Storytelling

- Data visualization expert Stephen Few said, “Data storytelling is a structured approach for communicating data insights, and it involves a combination of three key elements: data, visuals, and narrative”.

Story Structure

The Beginning

- The first thing to do is introduce the plot, building the context for your audience.
- Set up the essential elements of story:
 - the setting
 - main character
 - unresolved state of affairs
 - desired outcome
- Involve your audience, stimulating their interest and answering the questions that are likely on their mind:
 - *Why should I pay attention?*
 - *What is in it for me?*

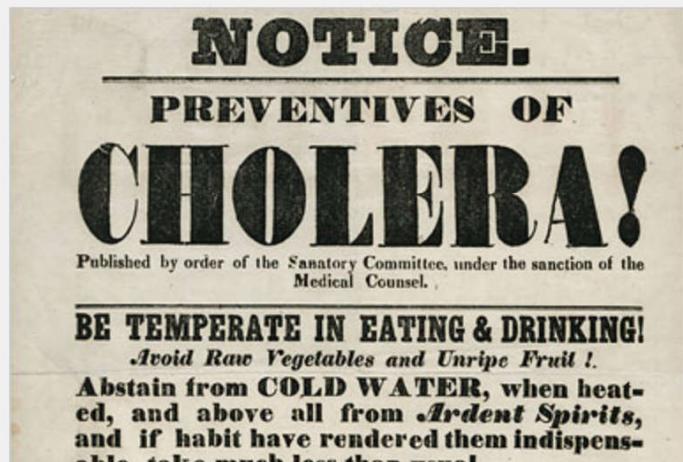

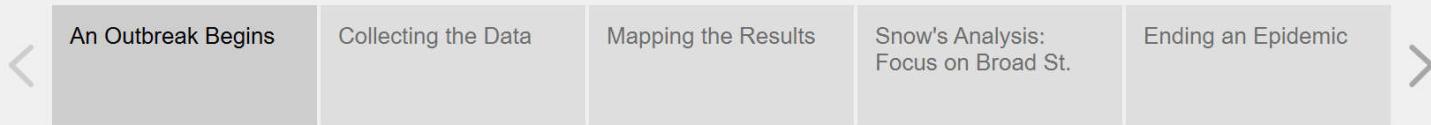

The Middle

- You retain your audience's attention through this part of the story by addressing *how* they can solve the problem you introduced.
 - Further develop the situation or problem by covering relevant background.
 - Incorporate external context or comparison points.
 - Give examples that illustrate the issue.
 - Include data that demonstrates the problem.
 - Articulate what will happen if no action is taken or no change is made.
 - Discuss potential options for addressing the problem.
 - Illustrate the benefits of your recommended solution.
 - Make it clear to your audience why they are in a unique position to make a decision or drive action.

The End

- End the story with a call to action:
 - make it totally clear to your audience what you want them to *do* with the new understanding or knowledge that you've imparted to them.
- One classic way to end a story is to tie it back to the beginning.
 - At the beginning of our story, we set up the plot and introduced the dramatic tension.
 - To wrap up, you can think about recapping this problem and the resulting need for action, reiterating any sense of urgency and sending your audience off ready to act.

London's 1854 Cholera Outbreak: Data Mapping Halts an Epidemic

Victorian medical advice was frequently off the mark by modern standards.

In 1854, a Cholera outbreak swept through the Soho neighborhood of London.

616 people died.

Physician John Snow was skeptical of existing theories of disease transmission, which often blamed "miasmas," or bad air. The germ theory of disease circulation had not yet been outlined.

London's 1854 Cholera Outbreak: Data Mapping Halts an Epidemic

An Outbreak Begins | Collecting the Data | Mapping the Results | Show's Analysis: Focus on Broad St. | Ending an Epidemic

This is Snow's original table showing the chronology of deaths and their total. He notes that not all deaths have recorded addresses; thus, his data set is partially incomplete.

Dr. Snow canvassed the neighborhood. He collected the addresses of those who died, noted the number of deaths at each location, and tabulated the results.

London's 1854 Cholera Outbreak: Data Mapping Halts an Epidemic

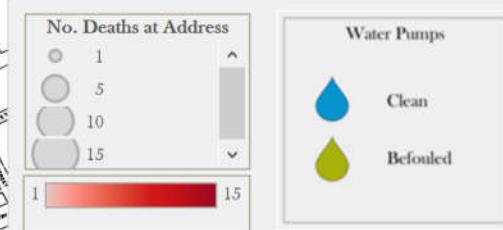

An Outbreak Begins < Collecting the Data Mapping the Results Snow's Analysis: Focus on Broad St. Ending an Epidemic >

Then, Snow mapped these data points onto a map of the Soho neighborhood.

The results were startling.

NB: The map reprinted here is Snow's original. I geocoded the addresses, introduced the number of deaths as a dimension in the dataset, and uploaded the map as a background image. Then, I conformed the dimensions of the map to the appropriate lat/long. Thus, the locations appear as they would have on Snow's map.

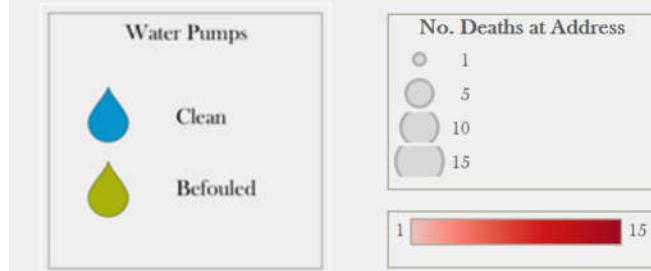

London's 1854 Cholera Outbreak: Data Mapping Halts an Epidemic

He noted that the bulk of deaths were concentrated in an area that generally used the same municipal water pump: Broad Street.

Snow realized that the Broad Street water pump—and poor water quality—was likely the source of the outbreak.

Armed with this information, he went to city ..

Mapping the Results

Snow's Analysis:
Focus on Broad St.

Ending an Epidemic

Snow advised that the Broad Street water pump be shut down immediately. City authorities found Snow's evidence persuasive, and they removed the handle from the pump.

The outbreak ended shortly thereafter.

John Snow's pioneering data analysis proved that cholera is a water-borne disease, and paved the way for the field of epidemiology.

It is one of the foundational cases of the systematic use of public health information to save lives.
